# 1 Browser connection

A computer with a web browser (Google Chrome, Microsoft Edge, or Mozilla Firefox) is used to receive live images, control the unit, and replay stored sequences. The unit is configured over the network using the browser.

# 1.1 System requirements

Our recommendations are:

- Computer with Dual core HyperThreading processor or better
- Graphic card with performance that matches or is better than the resolution of the camera
- Windows 10 or later
- Network access
- Google Chrome, Microsoft Edge, or Mozilla Firefox
  - or -

Application software, for example, Video Security Client, Bosch Video Client or BVMS.

# 1.2 Password protection in camera

The device is password-protected. The first time that any user accesses the device, the device will prompt the user to set a password at the service level.

The camera requires a strong password. Follow the prompts in the dialog box, which specifies what is required. The system measures the strength of the password that you enter.

Make sure the password obeys these conditions:

- 8 to 19 characters in length
- Upper and lower case letters
- Minimum of 1 digit
- Minimum of 1 special character

These special characters are not allowed: '@', '&', '<', '>', ':', '+'

When you use Configuration Manager to access your device for the first time, you must set the initial password of the device in Configuration Manager. The Users section (General > Unit Access > Users) displays the message, "Before you can use this device you have to secure it with an initial password."

**Note**: After you set the initial password, a "lock" icon appears next to the device name in the **Devices** list in Configuration Manager.

You can also launch the device webpage directly. In the device webpage, an initial password page appears, displaying input fields and a password strength gauge.

Enter the user name ("service") and a password in the appropriate fields. Refer to the section **User Management** for more information.

After a service-level password is set for the device, the device displays a dialog box that prompts users to enter the user name ("**service**") and the service-level password every time that they access the device.

- 1. Fill in the fields **User name** and **Password**.
- 2. Click **OK**. If the password is correct, the desired page appears.

Note: New releases of software may require you to set a new and stronger password.

### Notices for local certification - Korea

### Notice!

Use the internal USB-C port only for administration purposes.

### Notice!

This is an industrial product and has only been tested for industrial use. Do not use this product for residential or home monitoring purposes.

### Notice!

This product does not include an amplifier. For audio output, use a built-in amplifier speaker.

# 2 System overview

Note: None of the pages are accessible until after you set a service-level password.

When a connection is established, the **Live** page is initially displayed.

The application bar displays the following icons:

□	Live	Click this icon to view the live video stream.
<b>₽</b>	Playback	Click this icon to play back recorded sequences. This link is only visible if a storage medium has been configured for recording. (With VRM recording, this option is not active.)
<b>€</b>	Configuration	Click this icon to configure the device.
	Dashboard	Click this icon to see detailed system information.
	Links	Click this icon to navigate to the Bosch download store.
$\Theta$	Logout	Click this icon to log out of the device.
?		Click this icon to get context-sensitive help for the page you are browsing.

### 2.1 Live

The **Live** page is used to display the live video stream and control the unit.

# 2.2 Playback

The **Playback** page is used for playing back recorded sequences.

# 2.3 Configuration

The **Configuration** page is used to configure the unit and the application interface.

### **Making Changes**

Each configuration screen shows the current settings. You can change the settings by entering new values or by selecting a predefined value from a list field.

Not every page has a **Set** button. Changes to pages without a **Set** button are set immediately. If a page does show a **Set** button, you must click the **Set** button for a change to take effect.

### Notice!

Save each change with the associated **Set** button.

Clicking the **Set** button saves the settings only in the current field. Changes in any other fields are ignored.

Some changes only take effect after the unit is rebooted. In this case, the **Set** button changes to **Set and Reboot**.

1. Make the desired changes.

2. Click the **Set and Reboot** button. The camera reboots and the changed settings are activated.

# 2.4 Dashboard

The **Dashboard** page is used to display detailed information about the device.

The **Dashboard** is only visible in the application bar if the **Show 'Dashboard'** option is enabled by a service-level user in the **Configuration** -> **Web Interface** -> **Appearance** page.

# 3 Operation via the browser

# 3.1 Live page

After the connection is established, the **Live** page is initially displayed. It shows the live video image on the right of the browser window. Depending on the configuration, various text overlays may be visible on the live video image.

Other information may also be shown next to the live video image. The items shown depend on the settings on the **'Live' functions** page.

### Connection

In the Connection group, you can configure the Stream option.

### Image selection

To view a live stream:

- 1. On the left side of the browser, expand the **Connection** group if necessary.
- 2. Click the **Stream** drop-down arrow to see the options.
- 3. Select the stream you wish to view.

### Digital I/O

Depending on the configuration of the unit, the alarm input and the output are displayed next to the image. Expand the Digital I/O group if necessary.

The alarm symbol is for information and indicates the status of an alarm input:

The symbol lights when the input alarm is active.

The alarm output allows the operation of an external device (for example, a light or a door opener).

- To activate the output, click the checkmark symbol.
  - The symbol lights when the output is activated.

### **Recording status**

The hard drive icon below the live camera image changes during an automatic recording. The icon lights up and displays a moving graphic to indicate a running recording. If no recording is taking place, a static icon is displayed.

### Full-screen display

Click the full-screen icon to view the selected stream in full-screen mode; press **Esc** on the keyboard to return to the normal viewing window.

### **Saving snapshots**

Individual images from the displayed live video stream can be saved locally in JPEG format on the computer's hard drive. The storage location depends on the configuration of the camera.

Click the photo camera icon to save a single image.

### **Recording live video**

Video sequences from the displayed live video stream can be saved locally on the computer's hard drive. The sequences are recorded at the resolution specified in the encoder configuration. The storage location depends on the configuration of the camera.

- 1. Click the recording icon to record video sequences.
  - Saving begins immediately. The red dot on the icon indicates that a recording is in progress.

Click the recording icon again to stop recording.

### Start Video Security app

To start the Video Security app, click

### Show latest event

The Playback page opens.

### Storage, CPU and network status

When accessing the unit with a browser, the local storage, processor and network status icons are shown in the upper right of the window.

When a local storage card is available, the memory card icon changes color (green, orange or red) to indicate the local storage activity. If you hover over this icon with the mouse the storage activity is shown as a percentage.

If you hover over the middle icon, the CPU load is shown.

If you hover over the right-hand icon, the network load is shown.

This information can help with problem solving or when fine tuning the unit. For example:

- if the storage activity is too high, change the recording profile,
- if the CPU load is too high, change the VCA settings,
- if the network load is too big, change the encoder profile to reduce bitrate.

### Status icons

Various overlays in the video image provide important status information. The overlays provide the following information:

### Decoding error

The frame might show artifacts due to decoding errors.

# Alarm flag

Indicates that an alarm has occurred.

### **Communication error**

A communication error, such as a connection failure to the storage medium, a protocol violation or a timeout, is indicated by this icon.

Indicates a gap in the recorded video.

### Watermark valid

The watermark set on the media item is valid. The color of the check mark changes according to the video authentication method that has been selected.

Indicates that the watermark is not valid.

Indicates that a motion alarm has occurred.

Indicates that recorded video is being retrieved.

### 3.2 Playback page

D d Click Playback in the application bar to view, search or export recordings. This link is only visible when a direct iSCSI or memory card is configured for recording (with Video Recording Manager (VRM) recording this option is not active).

On the left side of the screen, there are four groups:

- Connection
- Search
- **Export**
- Track list

### 3.2.1 Selecting the recording stream

On the left side of the browser, expand the **Connection** group if necessary.

To view a recording stream:

- Click the **Recording** arrow to see the options.
- Select recording stream 1 or 2.

#### 3.2.2 **Searching for recorded video**

On the left side of the browser, expand the **Search** group if necessary.

- To limit the search to a particular time range, enter the date and times for the start and
- 2. Select an option from the drop-down box to define a search parameter.
- Click Search.
- The results are shown. 4.
- 5. Click a result to play it back.
- Click Back to define a new search.

#### 3.2.3 **Exporting recorded video**

On the left side of the browser, expand the Export group if necessary:

- Select a track in the track list or in the search results.
- The start and stop date and time are filled for the selected track. If necessary, change the
- 3. In the **Time lapse** drop-down box, select **Original**, to export the recorded video as its original, Condensed to export the recorded video condensed to the given output time.
- 4. In the **Location** drop-down box, select a target.
- 5. Click **Export** to save the video track.

The target server address is set on the **Connectivity** > **Accounts** page.

#### 3.2.4 Track list

The Track list shows all the available recordings.

### 3.2.5 **Controlling playback**

The time bar below the video image allows quick orientation. The time interval associated with the sequence is displayed in the bar in gray. Arrows indicate the position of the image currently being played back within the sequence.

The time bar offers various options for navigation in and between sequences.

- If required, click in the bar at the point in time at which the playback should begin.
- Change the time interval displayed by clicking the plus or minus icons or use the mouse scroll wheel. The display can span a range from six months to one minute.
- Click the alarm jump buttons to go from one alarm event to the next or to the previous one. Red bars indicate the points in time where alarms were triggered.

### Controls

Control playback by means of the buttons below the video image.

The buttons have the following functions:

- Start/Pause playback
- Select the playback (forward or backward) speed using the speed regulator
- Step forward or backward frame-by-frame when paused (small arrows)

#### 3.3 **Dashboard**

The **Dashboard** page shows information on 4 topics:

- **Device status**
- **Recording status**
- **Connection Status**
- Services

You can also download a .JSON file with information about the device:

- At the bottom of the page, locate the **Export** button
- 2. Click the **Export** button
- Select a location in your hard drive to store the file

### Configuration 4

### 4.1 General

#### 4.1.1 Identification

### **Device name**

Assign a unique name to assist in identification. This name simplifies the management of multiple devices in more extensive systems.

The name is used for remote identification, for example, in the event of an alarm. Choose a name that makes it as easy as possible to identify the location unambiguously.

Each device should be assigned a unique identifier that can be entered here as an additional means of identification.

### Video name

Each video channel can be given a name. Click the + sign to add an extra line.

### Host name

Enter the host name registered for the device.

### Initiator extension

Add text to an initiator name to make identification easier in large iSCSI systems. This text is added to the initiator name, separated from it by a full stop. (You can see the initiator name in the System Overview page.)

Click **Set** to apply the changes.

### 4.1.2 **User Management**

A password prevents unauthorized access to the device. You can use different authorization levels to limit access.

Proper password protection is only guaranteed when all higher authorization levels are also protected with a password. Therefore, you must always start from the highest authorization level when assigning passwords.

You can define and change a password for each authorization level if you are logged into the "service" user account.

### **Authentication modes**

The section Authentication modes provides information about the authentication modes set in the camera. A checkmark appears in the checkbox to the left of the mode if the mode is set. If the mode is not set, the phrase "No certificate installed" appears to the right of the mode name.

This device has three authentication modes:

- Password indicates a password is set for the camera. It prevents unauthorized access to the device, and can use different authorization levels to limit access.
  - Proper password protection is only guaranteed when all higher authorization levels are also protected with a password. Therefore, you must always start from the highest authorization level when assigning passwords.
  - You can define and change a password for each authorization level if you are logged into the service user account.
- Certificate. A check mark in this check box indicates that at least one certificate is loaded onto the device.

The Trusted certificate is a root certificate for Bosch Security Systems that proves that the device meets the following criteria:

It originates from a Bosch factory that is a secure environment.

7100i

It has not been tampered with.

The Trusted certificate is issued by Escrypt. Escrypt is a Bosch company and Certificate Authority (CA).

Active Directory server (AD FS). A check mark in this check box indicates that the device uses an active directory server.

Click **Set** to apply the changes.

### Creating a new user

To create a new user, click Add in the section below Authentication modes.

In the box **User**, fill in the fields:

- **User name**, Enter a name with a minimum of 5 and a maximum of 31 characters.
- **Group**, select the appropriate authorization level:
  - live is the lowest authorization level. At this level, it is only possible to view the live video image, and switch between the different live image displays.
  - user is a middle authorization level. At this level, it is possible to operate the device and playback recordings, but configuration changes are not possible.
  - **IVA configuration** is a middle authorization level. At this level, it is only possible to configure VCA, but access is available to all user level functions like PTZ and Replay.
  - service is the highest authorization level. Entering the correct password gives access to all the functions, and allows all configuration settings to be changed.
- 3. Type, select either:
  - Password for a new password.

Use a minimum of 8 and a maximum of 19 characters. The password must have upper-case and lower-case letters, one or more numerical digits and one or more of these special characters !? " # \$ % ( ) { } [ ] \* - = . , ; ^ | ~ \

Special characters such as space @: < > ' & + are not valid.

In this case, enter the new password a second time to eliminate typing mistakes.

- **Certificate** for a certificate that the new user is authorized to use.
- Click **Set** to confirm and create a new user.

### To edit a password

To edit a password, click the pencil icon to the right of the column **Type** for the appropriate User name.

#### 4.1.3 Date/Time

### **Date format**

Select the required date format from the dropdown menu.

### Device date/Device time

### Notice!

Make sure that recording is stopped before synching to the PC.

If there are multiple devices operating in your system or network, it is important to synchronize their internal clocks. For example, it is only possible to identify and correctly evaluate simultaneous recordings when all units are operating on the same time.

- Enter the current date. Since the unit time is controlled by the internal clock, there is no need to enter the day of the week - it is added automatically.
- Enter the current time or click the **Sync to PC** button to copy your computer's system time to the camera.

Note: It is important that the date/time is correct for recording. An incorrect date/time setting could prevent correct recording.

### **Device time zone**

Select the time zone in which the system is located.

### Daylight saving time

The internal clock can switch automatically between normal and daylight saving time (DST). The unit already contains the data for DST switch-overs for many years in advance. If the date, time and zone have been set up correctly, a DST table is automatically created.

If you decide to create alternative daylight saving time dates by editing the table, note that values occur in linked pairs (DST start and end dates).

First, check the time zone setting. If it is not correct, select the appropriate time zone and click Set.

- 1. Click **Details** to edit the DST table.
- Click **Generate** to fill the table with the preset values from the unit.
- Click one of the entries in the table to make changes. The entry is highlighted.
- 4. Click **Delete** to remove the entry from the table.
- Choose other values from the list boxes under the table, to change the selected entry. Changes are immediate.
- If there are empty lines at the bottom of the table, for example after deletions, add new 6. data by marking the row and selecting values from the list boxes.
- When finished, click **OK** to save and activate the table.

### Time server address

The camera can receive the time signal from time server using various time server protocols, and then use it to set the internal clock. The unit polls the time signal automatically once every minute.

Enter the IP address of a time server here.

You can choose to have the DHCP server give a time server date by selecting the **Overwrite by DHCP** option.

### Time server type

Select the protocol that is supported by the selected time server.

- Select **Time protocol** if the server uses the protocol RFC 868.
- The SNTP protocol supports a high level of accuracy and is required for special applications and subsequent function extensions.
- Select **TLS protocol** if the server uses the RFC 5246 protocol.
- Select Off to disable the time server.

Click **Set** to apply the changes.

#### 4.2 Web Interface

### 4.2.1 **Appearance**

You can adapt the appearance of the web interface and change the website language to meet your requirements.

### Website language

Select the language for the user interface.

The default language is English.

After setting the new language, the page refreshes automatically. The GUI now displays field names and options, as well as OSD messages, in the selected language.

### **Company logo**

To replace the company's logo in the top-right part of the window, enter the path to a suitable image in this field. The image file must be stored on a web server.

### **Device logo**

To replace the device name in the top-left part of the window, enter the path to a suitable image in this field. The image file must be stored on a web server.

GIF or JPEG images can be used to replace the company and device logos. The image can be stored on a web server (for example, http://www.myhostname.com/images/logo.gif). Ensure that a connection to the web server is always available to display the image, since the image files are not stored on the unit.

To reuse the original image, delete the entries in the fields Company logo and Device logo.

### Show VCA metadata

When video content analysis (VCA) is activated, additional information is displayed in the live video stream. With the MOTION+ analysis type, for example, the sensor fields in which motion is recorded are marked with yellow rectangles.

Using Intelligent Video Analytics, the outlines of detected objects are displayed in these colors:

- Red: Objects that generate an alarm event under the current settings appear on the camera image inside a red outline.
- Orange: An object that triggered an alarm event but does not generate another one
  appears inside an orange outline (example: object has crossed a line). During forensic
  search, an object that triggers an alarm event has an orange outline from the beginning.
- Yellow: Objects that are detected as moving but do not generate an alarm event under the current settings appear inside a yellow outline.

# **Show VCA trajectories**

For devices with Essential Video Analytics or Intelligent Video Analytics, the trajectories (motion lines of objects) from the video content analysis are shown in the live video image if a corresponding analysis type is activated. The trajectory is shown as a green line that follows the object's base point.

### Show overlay icons

Select this check box to show overlay icons on the live video image.

### Show VCA items

Select this checkbox to show VCA items on the live video image.

Shows alarm fields, lines and routes configured for the video analytics in the following colors:

- Green: Fields, lines and routes used in a task are displayed in green. They can be edited but not deleted.
- Red: Fields, lines and routes currently in alarm mode are displayed in red.

### Show 'Dashboard'

Select this checkbox to enable the **Dashboard** in the application bar.

### Secure cookies

Select this checkbox to secure the cookies sent through the camera.

### Notice!

If cookies are secured, authentication forwarding to MPEG ActiveX and the Video Security App is prohibited.

### Video player

Select the type of player to be used for live mode viewing.

### Latency mode

Select the required latency mode:

- Low delay: Default mode. Provides marginal buffering to display fluent video under normal network conditions.
- Smooth video: Allows the buffer to automatically adjust to cover network jitter, inducing higher latency.
- No buffering: Shows video as it is received by the decoder with minimum latency. Allows the video to jerk if there is network jitter.

### Video buffer

The value shown is calculated from the **Latency mode** setting. It cannot be changed.

### JPEG resolution

You can specify the size of the JPEG image on the Live page. Options are Small, Medium, Large, 720p, 1080p, and Resource based (default).

### JPEG interval

You can specify the interval at which the individual images should be generated for the M-JPEG image on the **Live** page.

Enter a time interval (in milliseconds). The default is 0.

### JPEG quality

You can specify the quality at which the JPEG images appear on the **Live** page.

This option is only available, if JPEG resolution is not set to Resource based.

Click **Set** to apply the changes.

#### 4.2.2 'Live' functions

You can adapt the Live page functions to meet your requirements. Choose from a variety of different options for displaying information and controls.

- Select the check boxes for the functions to be displayed on the **Live** page. The selected elements are checked.
- Check to see if the desired items are shown. 2.

### Transmit audio

When selected, the audio from the camera (if set to **On** on the **Audio** page) is sent to the computer. This setting applies only to the computer on which the selection is made. Transmitting audio data requires additional network bandwidth.

### Auto logout time [min]

Set a time frame (in minutes) for the automatic logout. Default value is 0 (no automatic logout).

### Show alarm inputs

The alarm inputs are displayed next to the video image as icons along with their assigned names. If an alarm is active, the corresponding icon changes color.

### Show alarm outputs

Alarm outputs are shown next to the video image as icons along with their assigned names. If an output is switched, the icon changes color.

### Allow snapshots

Specify whether the icon for saving individual images should be displayed below the live image. Individual images can only be saved if this icon is visible.

### Allow local recording

Specify whether the icon for saving video sequences locally should be displayed below the live image. Video sequences can only be saved locally on your hard disk if this icon is visible.

### Path for JPEG and video files

Enter the path for the storage location of individual images and video sequences saved from the Live page.

### Video file format

Select a file format for the live page display. The MP4 format does not include metadata. Click **Set** to apply the changes.

### 4.3 Connectivity

#### 4.3.1 Cloud Services

### Remote Portal

### Operation

The operation mode determines how the camera communicates with the Remote Portal.

- Select **On** to poll the server constantly.
- Select Off to block polling.
- Select Re-register to different account if you want to register the camera to another Remote Portal account.

### Connectivity state

This field identifies any cloud-based services with which the camera communicates.

- If you have registered the device on a cloud-based service such as Bosch Remote Portal, then this field identifies this fact ("Connected").
  - Note: The button (Visit Remote Portal) to connect to the device with that service is
- If you have not registered the device, then the message, "Not available. When 'Operation' is set to 'Auto', 'Automatic IP assignment (DHCP)' must be active to connect to the Remote Portal" appears.

Note: The button (Visit Remote Portal) to connect to the device with that service is not active.

### Partner services

### App management Portal

### Connectivity state

This field indicates the device's connectivity state with the cloud service.

Click to be redirected to the App Management Portal page.

### Stratocast

### Registration code

This area displays the state of the Stratocast registration code.

### **Connectivity state**

This field indicates the device's connectivity state with the cloud service.

Click **Register** to register to the cloud-based surveillance service.

#### 4.3.2 Accounts

Four separate accounts can be defined for posting and recording export.

Select the account type.

### **Account name**

Enter an account name to be shown as the target name.

### IP address

Enter the IP address for an FTP server.

### Login

Enter your login name for the account server.

Enter the password that gives access to the account server. Click Check to confirm that it is correct.

### Path

Enter an exact path to post the images on the account server. Click Browse... to browse to the required path.

### Maximum bit rate

Enter the maximum bit rate in kbps that will be allowed when communicating with the account.

### **Encryption**

Tick the box to use a secure FTP over TLS connection.

Click Set to apply the changes.

#### 4.3.3 **DynDNS**

A dynamic Domain Name Service (DNS) allows you to select the unit via the Internet using a host name, without having to know the current IP address of the unit. You can enable this service here. To do this, you must have an account with one of the dynamic DNS providers and you must register the required host name for the unit on that site.

For information about the service, registration process and available host names refer to the provider.

### **Provider**

Select your dynamic DNS Provider from the drop-down list.

### **Host name**

Enter the host name registered for the unit.

### **User name**

Enter the user name you registered.

### **Password**

Enter the password you registered.

### Force registration now

Force the registration by transferring the IP address to the DynDNS server. Entries that change frequently are not provided in the Domain Name System. It is a good idea to force the registration when setting up the device for the first time. Only use this function when necessary and no more than once a day, to avoid the possibility of being blocked by the service provider. To transfer the IP address of the device, click the Register button.

### **Status**

The status of the DynDNS function is displayed here for information purposes; these settings cannot be changed.

Click **Set** to apply the changes.

### 4.4 **User Apps**

### 4.4.1 App Management

User apps are purchased from the Azena app store, available at https://store.azena.com/ shop/.

Follow these steps to install or manage a user app:

- Connect the device to Remote Portal, available at https://remote.boschsecurity.com
- In Remote Portal, select the device to which you want to add user apps
- In Remote Portal, navigate to your device's **Installed Apps** section
- At the top of the page, enable Azena Cloud Connection
- At the top of the page, click the Register Device button next to Azena App Management **Portal**
- 6. Open the Azena App Management portal
- Install or manage the user app in the Azena App Management portal

You can also install user apps offline through the Configuration Manager. To install user apps offline, you must obtain the license and the app files from Azena.

#### 4.5 Camera

#### 4.5.1 Installer Menu

### Sensor mode

The Sensor mode specifies how many images per second the sensor captures and also in what resolution it captures these images.

### Image rotation

Select the required angle (0°, 90°, 180° or 270°) to output the correct image orientation.

### Mirror image

Select **On** to output a mirror image of the camera picture.

### Reboot device

Click **Reboot** to restart the device.

### **Factory defaults**

Click **Defaults** to restore the factory defaults for the camera. A confirmation screen appears. Allow several seconds for the camera to optimize the picture after a reset.

### Restore settings

Click **Restore** to restore all settings, except network settings, to their defaults.

Note: Clicking this button also clears the service-level password. Operators must reset the password before doing anything else.

Click Set to apply the changes.

### 4.5.2 Display Stamping

Various overlays or stamps in the video image provide important supplementary information. These overlays can be enabled individually and arranged on the image in a clear manner. The drop-down menus below allow the configuration of the individual stamping options. The respective sample windows show a preview of the configured text and background styles. Click Set to apply the changes.

### Global configuration

### Notice!

These options can also be configured individually for all stamping settings. Any changes to the global configuration settings will be applied to all stamping settings!

### Stamping size

Select the desired font size of the overlays on the OSD: Normal Large or Custom.

Select Custom to enable the Font size (%) field.

### **Text color**

Select the color for the alarm message to be displayed in.

### **Background color**

Select the background color for the alarm message to be displayed in.

If you have enabled the Transparent background option, the background color is not displayed in the OSD.

### **Camera name stamping**

### **Position**

Select the position of the camera name overlay in the drop-down box. It can be displayed at the Top, at the Bottom, or at a position of choice using the Custom option, or it can be set to **Off** for no overlay information.

If the **Custom** option is selected, enter values in the X and Y position fields.

Optionally, tick the Underlay with full-width bar box to place a full-width background-bar beneath the time stamp.

### Notice!

Camera / video names can be changed under **General** > **Identification**.

### Logo stamping

### Logo

To place a logo on the image, select and upload an uncompressed .bmp file with a maximum size of 300 x 300 pixels and 256 colors to the camera.

### Logo position

Use the drop-down menu to select the position of the logo or to hide it (Off).

### **Time stamping**

### Display milliseconds

Click this check box to display the milliseconds in the time stamp.

Note: This information can be useful for recorded video images, however, it does increase the processor's computing time.

### Alarm mode stamping

### Alarm message

Enter the message to be displayed on the image in the event of an alarm. The maximum text length is 32 characters.

### 7100i

### Stream security

Select from the Video authentication drop-down box a method for verifying the integrity of

If you select **Watermarking**, all images are marked with an icon. The icon indicates if the sequence (live or saved) has been manipulated.

If you want to add a digital signature to the transmitted video images to ensure their integrity, select one of the cryptographic algorithms for this signature.

Set the Signature interval [s] for the selected authentication method.

Click **Set** to apply the changes.

### 4.5.3 **Positioning**

The **Positioning** feature describes the location of the camera and the perspective in the camera's field of view.

Perspective information is essential to Video Analytics, as it enables the system to compensate for the illusory smallness of distant objects.

Only through use of perspective information is it possible to distinguish objects such as persons, bicycles, cars and trucks, and accurately compute their real size and speeds as they move through 3D space.

However, to calculate perspective information accurately, the camera must be directed at a single, flat horizontal plane. Multiple and inclined planes, hills, stairs can falsify perspective information and produce incorrect object information such as size and speed.

### **Mounting position**

The mounting position describes the perspective information that is also often called calibration.

In general, the mounting position is determined by the parameters of the camera such as height, roll angle, tilt angle, and focal length.

The height of the camera must always be entered manually. Whenever possible, roll angle and tilt angle are provided by the camera itself. The focal length is provided, if the camera has a built-in lens.

### Tilt angle [°]

Enter the tilt angle if the value is not determined by the camera.

The tilt angle describes the angle between the horizontal and the camera.

A tilt angle of 0° means that the camera is mounted parallel to the ground.

A tilt angle of 90° means that the camera is mounted vertically in bird's eye view perspective.

The flatter the tilt angle is set, the less accurate the estimate of object sizes and speeds will be. The settings must be between 0° and 90°. Estimates are no longer possible when you have reached 0°.

# Roll angle [°]

Enter the roll angle if the value is not determined by the camera.

The roll angle describes the angle between the roll axis and the horizontal plane. The angle can deviate from the horizontal by up to 45°.

### Height [m]

Enter the height in meters of the position of the camera.

The height describes the vertical distance from the camera to the ground plane of the captured image. Typically the elevation of the mounted camera above the ground.

### Focal length [mm]

Enter the focal length in millimeters of the position of the camera if the value is not determined by the camera.

The focal length is determined by the lens. The shorter the focal length, the wider the field of view. The longer the focal length, the narrower the field of view and the higher the magnification.

### Show sensor values...

Click to automatically see the camera parameters, for example, Tilt angle [°], Roll angle [°] and Focal length [mm]. These calibration values are measured by the device sensors. Click OK to transfer them to the **Positioning** settings page.

### Sketch

Click to improve the automatic calibration. The **Sketch-based calibration** window is displayed. The **Sketch** functionality offers an additional, half-automatic calibration method. This calibration method allows you to describe the perspective in the camera's field of view by drawing vertical lines, ground lines, and ground angles in the camera image and entering the correct size and angle. Use the **Sketch** functionality if the result of the automatic calibration is not sufficient.

You can also combine this manual calibration with the values for roll angle, tilt angle, height and focal length calculated by the camera or entered manually.

Select the Calculate check box to obtain the roll angle, tilt angle, height and focal length from the sketched calibration elements - vertical lines, ground lines and angles - you have placed in the camera.

Clear the **Calculate** check box to enter a value manually or to refresh to the values provided by the camera itself.

### Calibrating cameras using the Sketch-based calibration window

To determine non-automatically set values:

- Enter the value for tilt angle, roll angle, height and focal length if the value is known, for example, by measuring the height of the camera above the ground, or reading the focal length from the lens.
- For each value that is still unknown, select the Calculate check box, then place a calibration element on the camera image. Use these calibration elements to trace individual outlines of the displayed environment in the camera image and define the position and size of these lines and angles.
  - Click T to place a vertical line across the image. A vertical line corresponds to a line that is perpendicular to the ground plane, such as a door frame, edge of a building or a lamp post.
  - Click **t** o place a line across the ground in the image. A line on ground corresponds to a line that is on the ground plane, such as a road marking.
  - Click to place an angle on the ground in the image. The angle on ground represents an angle lying on the horizontal ground plane, such as the corner of a carpet or parking bay markings.
- Adjust the calibration elements to the situation:
  - Enter the real size of a line or angle. To do this, select the line or angle, then enter the size in the corresponding box.

**Example**: You have placed a line on ground across the lower side of an automobile. You know that the automobile is 4 m long. Enter 4 m as the length of the line.

Adjust the position or length of a line or angle. To do this, drag the line or angle or move the end points to the desired position in the camera image.

7100i

Remove a line or angle. To do this, select the line or angle, then click the trash can icon.

### Note:

**Blue** lines indicate calibration elements added by you.

White lines represent the element as it should be positioned on the camera image based on the current calibration results or the determined calibration data.

### Notice!

If the distance to the camera (geolocation) is not relevant, it is enough to determine height and focal length in relation to each other. This allows a simple calibration by marking 2-3 persons - each with a vertical line - and setting their size. 1,80 m (71 in.) for all is sufficient. Use at least one person in the front and one person in the background of the image for best results.

### Coordinate system

Select the coordinate system and enter the appropriate values in the additional input fields that appear depending on the coordinate system selected.

The Coordinate system feature describes the position of the camera in a local Cartesian or the global WGS 84 coordinate system. The camera and the objects tracked by the video analytics are displayed on a map.

### Cartesian

The Cartesian coordinate system describes each point in the space by a combination of the position on three orthogonal axes X, Y and Z. A right-handed coordinate system is used, where X and Y span the ground plane and Z describes the elevation of the ground plane.

The location of the camera on the ground on the X-axis.

### Y [m]

The location of the camera on the ground on the Y-axis.

The elevation of the ground plane. To determine the elevation of the camera, add the **Z [m]** value and the **Height [m]** value of the camera.

### Azimuth [°]

The orientation of the camera in a counter-clockwise angle starting with 0° in the east (WGS 84) or on the X-axis (Cartesian). If the camera is directed towards the north (WGS 84) or the Y-axis (Cartesian), the azimuth is 90°.

### **WGS 84**

The WGS 84 coordinate system is a spherical coordinate system description of the world and used in many standards including GPS.

Latitude is the north-south position of the camera in the spherical coordinate system WGS 84.

### Longitude

Longitude is the east-west position of the camera in the spherical coordinate system WGS 84.

### Ground level [m]

The elevation of the ground above sea level. To determine the elevation of the camera, add the Ground level [m] value and the Height [m] value of the camera.

### Azimuth [°]

The orientation of the camera in a counter-clockwise angle starting with 0° in the east (WGS 84) or on the X-axis (Cartesian). If the camera is directed towards the north (WGS 84) or the Y-axis (Cartesian), the azimuth is 90°.

Click **Set** to apply the changes.

#### 4.5.4 Image settings

### **Exposure**

### Mode

Select the appropriate mode from the drop down list.

Select Auto to let the camera optimize the exposure. The exposure settings of the camera can be fixed in Manual mode

### Shutter time [us]

The sensor integration time can be set in manual exposure mode.

The gain can be set in manual exposure mode.

### Iris [dB]

The lens aperture can be set in manual mode.

Adjust the sliders to the appropriate level.

### Day/night

Select the appropriate mode from the drop-down list.

- Auto the device switches the IR cut-off filter on and off depending on the scene illumination level.
- **Color** the device always produces a color signal regardless of light levels.
- **Monochrome** the IR cut-off filter is removed, giving full IR sensitivity.

### Zoom/Focus

### **Zoom position**

Adjust the field of view by changing the focal length of the lens.

### **Focus position**

Adjust the sliders to the appropriate level.

Adjust the optimal focus position manually (adjust the zoom position before fine tuning the focus position).

### **Autofocus**

Click Autofocus to have the device automatically adjust for the optimal focus position.

### White balance

Select the appropriate white balance mode from the drop-down list.

Select **Auto** to let the camera optimize the white balance. In Manual RGB mode the Red, Green, and Blue gain can be manually set to a desired position by adjusting the R-gain and Bgain.

### R-gain

In Manual white balance mode, adjust the red gain slider to offset the factory white point alignment (reducing red introduces more cyan).

### B-gain

In Manual white balance mode, adjust the blue gain slider to offset the factory white point alignment (reducing blue introduces more yellow).

### 7100i

#### 4.5.5 **Encoder Streams**

When this menu is accessed while the device is recording, the following message appears at the top of the page: "Recording is currently active. At 'Active profile' the stream profile used for recording is displayed, and overrules the 'Non-recording profile'."

### Stream prioritization

Select the stream that should not drop any frame.

### **Coding standard**

Select the coding standard you want to use for the stream.

### **Active profile**

Select one of the following profiles for each stream:

Profile number	Default Profile name	Description
Profile 1	HD Image Optimized	For an HD image, the video bit rate and frame quality are adjusted to ensure that the picture quality is the priority.
Profile 2	HD Balanced	For an HD image, the video bit rate and frame quality are adjusted to a median profile for everyday use.
Profile 3	HD Bit Rate Optimized	For an HD image, the video bit rate and frame quality are adjusted to ensure that the bit rate is the priority.
Profile 4	SD Image Optimized	For an SD image, the video bit rate and frame quality are adjusted to ensure that the picture quality is the priority.
Profile 5	SD Balanced	For an SD image, the video bit rate and frame quality are adjusted to a median profile for everyday use.
Profile 6	SD Bit Rate Optimized	For an SD image, the video bit rate and frame quality are adjusted to ensure that the bit rate is the priority.
Profile 7	DSL Optimized	Ideal for encoding on a DSL uplink where bit rate limitations are critical.
Profile 8	3G Optimized	Ideal for encoding on a 3G uplink where bit rate limitations are critical.

Stream 1 always runs at maximum selected resolution in stream limits. On stream 2 and 3, you can select various downscaled resolutions.

### Non-recording profile

Select one of the resolutions from the drop-down menu for each stream.

### Permanent metadata display

Select one of the options from the drop down menu for each stream.

Options include Off, On, or Privacy mode.

This functionality has no effect on video processed by 3rd party apps.

Click **Set** to apply the changes.

#### 4.5.6 **Encoder Statistics**

This section gives the user information about the bit rate of the device. For each scene, it is possible to determine the best target/max bit rate through the graphic shown.

### Stream

Identifies the current stream.

### 700m

Identifies the current zoom factor of the camera (1x, 2x, 4x, or 8x).

### Averaging period

Identifies how often (in seconds, minutes, hours, days or weeks) the encoder time is synchronized to the actual time.

### 4.5.7 **Encoder Regions**

Encoder regions are used to increase or decrease the encoding quality for selectable areas of the image. They can be used to give better control of the bitrate by enhancing the encoding quality of important regions (objects) and decreasing the encoding quality of less important regions (background).

Eight encoder regions can be defined:

- Select one of the eight available regions from the drop-down box.
- 2. Click the + box to add an area.
- Use the mouse to define the area covered by the region.
  - Drag the center, corner points, or sides of the shaded area.
  - Double-click on a side to add additional points to the area.
- 4. Select the encoder quality to be used for the defined area.
- 5. If required, select another region and repeat the steps.
- 6. To remove a region, select the area and click the waste bin icon.
- Click **Set** to apply the region settings. 7

#### 4.5.8 **Privacy Masks**

**Privacy Masks** block specific areas of a scene from being seen in the camera's field of view. This can be useful when public spaces are in the coverage area or monitoring will be limited to a particular zone.

### **Pattern**

Select the color of the mask as it will appear in the live video: Black, Gray, White or

### Custom color.

To configure a **Privacy mask**:

- Select the mask number from the drop-down list.
- Click the plus button.
- Adjust the mask in the image:
- Double-click on the edges to add or remove nodes.
- Click and drag the nodes to position them correctly.
- Check the **Enabled** check box to activate the related mask.
- Click the **Set** button to apply the related changes.

### To delete a **Privacy mask**:

- Select the mask number from the drop-down list.
- Click the trashcan icon.
- Click the **Set** button to apply the changes.

### 4.5.9 Audio

You can set the gain of the audio signals to suit your specific requirements. The live video image is shown in the window to help you check the audio source. Your changes are effective immediately.

If you connect via Web browser, you must activate the audio transmission on the 'Live' functions page. For other connections, the transmission depends on the audio settings of the respective system.

The audio signals are sent in a separate data stream parallel to the video data, and so increase the network load. The audio data is encoded according to the selected format and requires additional bandwidth. If you do not want any audio data to be transmitted, select Off.

Enable or disable the audio recording option.

### Input volume

Adjust the audio level with the slider(s). Adjust so that the indicator does not go into the red zone.

### **Line Out**

Adjust the audio level with the slider(s). Adjust so that the indicator does not go into the red zone.

### **Recording format**

Select a format for audio recording. The default value is 48 kbps. You can select 80 kbps, G.711 or L16 depending on the required audio quality or sampling rate.

AAC audio technology is licensed by Fraunhofer IIS.

(http://www.iis.fraunhofer.de/amm/)

### Send audio

Audio can be sent via the **Send audio** button if the unit supports audio. The button activates the audio backchannel connection.

- Click and hold the **Send audio** button to send an audio signal to the unit.
- Release the button to stop sending audio.

You must have a speaker or similar connected to the line out of the camera in order to send the audio.

Click **Set** to apply the changes.

#### 4.5.10 **Pixel Counter**

The number of horizontal and vertical pixels covered by the highlighted area is displayed below the picture. With these values you can check whether the requirements for specific functions, for example, identification tasks, are fulfilled.

- Click Freeze to freeze the camera image if the object that you want to measure is moving.
- To reposition a zone, place the cursor over the zone, hold down the mouse button and drag into position.
- To change the shape of a zone, place the cursor over the edge of the zone, hold down the mouse button and drag the edge of the zone to the required position.

### 4.6 Recording

Images can be recorded to an appropriately configured iSCSI system or, for devices with an SD slot, locally to an SD card.

SD cards are the ideal solution for shorter storage times and temporary recordings. They can be used for local alarm recording or to improve the overall reliability of video recording.

For long-term authoritative images use an appropriately sized iSCSI system.

Two recording tracks are available (Recording 1 and Recording 2). The encoder streams and profiles can be selected for each of these tracks for both standard and alarm recordings. Ten recording profiles are available where these recording tracks can be defined differently. These profiles are then used for building schedules.

A Video Recording Manager (VRM) can control all recording when accessing an iSCSI system. The VRM is an external program for configuring recording tasks for video servers.

#### 4.6.1 **Storage Management**

### **Device manager**

The Device manager indicates if storage is controlled locally or by a VRM system. An external Video Recording Manager (VRM) system for the unit is configured via the Configuration Manager.

### **Recording media**

Select a media tab to connect to the available storage media.

To use an iSCSI system as the storage medium, a connection to the desired iSCSI system is required to set the configuration parameters.

The storage system selected must be available on the network and completely set up. It must have an IP address and be divided into logical drives (LUNs).

- Enter the IP address of the required iSCSI destination in the **iSCSI IP address** field.
- If the iSCSI destination is password protected, enter the password into the **Password** field.
- 3. Click Read.
  - The connection to the IP address is established.

The **Storage overview** field displays the logical drives.

### **Local Media**

A microSD card inserted in the camera can be used for local recording.

If the microSD card is password protected, enter the password into the Password field. The **Storage overview** field shows the local media.

Note: microSD card recording performance is highly dependent on the speed (class) and performance of the microSD card. It is recommended to use an Industrial microSD card.

### Local storage

To activate the ANR settings, **Recording 1** must be assigned to an iSCSI target and **Recording** 2 to a local storage.

This function enables recording to the iSCSI target. If there is a network disconnection, the video is recorded to the local storage. When the network is recovered, the video recorded to the local storage is transferred to the iSCSI target and completes the missing information.

### Activating and configuring storage media

Available media or iSCSI drives must be transferred to the Managed storage media list, activated, and configured for storage.

An iSCSI target storage device can only be associated with one user. If a target is being used by another user, ensure that the current user no longer needs the target before decoupling that user.

- 1. In the **Storage overview** section, double-click a storage medium, an iSCSI LUN or one of the other available drives.
  - The medium is added as a target in the **Managed storage media** list.
  - Newly added media is shown as Not active in the Status column.
- 2. Click Set to activate all media in the Managed storage media list.
  - The **Status** column shows all media as **Online**.
- 3. Check the box in the **Rec. 1** or **Rec. 2** column to specify the recording tracks to be recorded on the target selected.

### Deactivating storage media

A storage medium in the **Managed storage media** list can be deactivated. It is then no longer used for recordings.

- 1. Click a storage medium in the Managed storage media list to select it.
- 2. Click **Remove** below the list. The storage medium is deactivated and removed from the list

### Formatting and wiping storage media

Formatting the storage media can be necessary to delete all data and recreate a valid file structure to be usable.

All recordings on a storage medium can be deleted at any time. Check the recordings before deleting and back-up important sequences on the computer's hard drive.

- 1. Click a storage medium in the Managed storage media list to select it.
- 2. Click Edit below the list.
- 3. Click Format in the new window to delete all recordings in the storage medium.
- 4. Click **OK** to close the window.

Wiping the storage media deletes all data without recreating a valid file structure.

To wipe the recordings from the storage media:

- 1. Click a storage medium in the **Managed storage media** list to select it.
- 2. Click **Edit** below the list.
- 3. Click **Wipe** in the new window to wipe the recordings in the storage medium.
- 4. Click **Close** to close the window.

Click Set to apply the changes.

# 4.6.2 Recording Profiles

A recording profile contains the characteristics of the tracks that are used for recording. These characteristics can be defined for ten different profiles. The profiles can then be assigned to days or times of day on the **Recording Scheduler** page.

Each profile is color-coded. The names of the profiles can be changed on the **Recording Scheduler** page.

To configure a profile click its tab to open its settings page:

- To copy the currently visible settings to other profiles, click Copy Settings. A window opens to select the target profiles for the copied settings.
- If you change a profile's settings, click Set to save.
- If necessary, click **Default** to return all settings to their factory defaults.

### Stream profile settings

Select the encoder profile setting that is to be used with stream 1 and 2 when recording. This selection is independent of the selection for live stream transmission. (The properties of the encoder profiles are defined on the **Encoder Profile** page.)

### Settings for selected recordings

### **Recording includes**

Select what is to be included in the recordings:

- Audio: If audio is not enabled, Off is shown. Click on Off and the page is redirected to the Audio section.
- Metadata.

You can specify whether, in addition to video data, audio data and metadata (for example alarms, VCA data and serial data) should also be recorded. Including metadata could make subsequent searches of recordings easier but it requires additional storage capacity.

### Caution!

Without metadata, it is not possible to include video content analytics in recordings.

Select the mode for standard recordings:

- Continuous: the recording proceeds continuously. If the maximum recording capacity is reached, older recordings are overwritten automatically.
- Pre-alarm: recording takes place in the pre-alarm time, during the alarm and during the post-alarm time only.
- Off: no automatic recording takes place.

Select the stream to be used for standard recordings:

- Stream 1
- Stream 2
- I-frames only

### **Alarm recording**

Select a period for the **Pre-alarm time** from the list box. The RAM option allows the pre-alarm recording ring buffer to be stored in RAM as long as it fits, depending on bit rate settings. This avoids writing to the SD card or iSCSI. The pre alarm ring is written to storage only on alarm. Select a period for the **Post-alarm time** from the list box.

### Alarm stream

Select the stream to be used for alarm recordings:

- Stream 1
- Stream 2
- **I-frames only**

Check the encoding interval and bit rates from profile: box and select an encoder profile to set the associated encoding interval for alarm recording.

### **Export to account**

To send standard H.264 or H.265 files to the target address, select an account and check **Export from memory.** 

If the target has not yet been defined, click Configure accounts to jump to the Accounts page where the server information can be entered.

### **Alarm triggers**

Select the alarm type that is to trigger an alarm recording:

- Alarm input
- **Analysis alarm**

Select the Virtual alarm sensors that are to trigger a recording, via RCP+ commands or alarm scripts, for example.

### 7100i

### **Configure accounts**

Sends you to the Accounts page.

### **Copy Settings**

You can copy the settings from one profile to another with the Copy Settings button. Select the target profile and click **OK**.

### Default

The default values are restored.

Click **Set** to apply the changes.

#### 4.6.3 **Maximum Retention Time**

Recordings are overwritten when the retention time entered here has expired.

Enter the required retention time in days for each recording track.

Click **Set** to apply the changes.

#### 4.6.4 **Recording Scheduler**

The recording scheduler allows you to link the created recording profiles to the days and times at which the camera's images are to be recorded. Schedules can be defined for weekdays and for holidays.

### Weekdays

Assign as many time periods (in 15-minute intervals) as needed for any day of the week. Move the mouse cursor over the table - the time is displayed.

- Click the profile to be assigned in the **Time periods** box.
- Click a field in the table and, while holding down the left mouse button, drag the cursor across all of the fields to be assigned to the selected profile.
- Click the **No recordings** profile in the **Time periods** box to deselect the intervals. 3.
- 4 Click **Select All** to select all of the intervals to be assigned to the selected profile.
- Click Clear All to deselect all of the intervals.
- When finished, click **Set** to save the settings to the device. 6.

# **Holidays**

Define holidays whose settings will override the settings for the normal weekly schedule.

- Click the **Holidays** tab. Days that have already been defined are shown in the table.
- Click Add. A new window opens. 2.
- Select the desired **From** date from the calendar. 3
- 4. Click in the **To** box and select a date from the calendar.
- Click **OK** to accept the selection which is handled as a single entry in the table. The window closes.
- Assign the defined holidays to the recording profile as described above.
- To delete a user-defined holiday, click on the trashcan of the respective holiday.

Click Set to apply the changes.

### Time periods

Change the names of the recording profiles listed in the **Time periods** box.

- 1. Click a profile.
- Click Rename. 2.
- Enter the new name and click **Rename** again.

### **Activating recording**

After completing configuration, activate the recording schedule and start scheduled recording. Once activated, the Recording Profiles and the Recording Scheduler are deactivated and the configuration cannot be modified. Stop scheduled recording to modify the configuration.

- Click **Start** to activate the recording schedule.
- Click **Stop** to deactivate the recording schedule. Recordings that are currently running are interrupted and the configuration can be modified.

Click **Set** to apply the changes.

#### 4.6.5 Recording Status

Details of the recording status are displayed here for information. These settings cannot be changed.

#### 4.6.6 **Recording Statistics**

The bit rate of the recorded video (blue) and other data (grey), such as audio and metadata, are shown in the graphic.

### Recording

Identifies the current recording profile (1 or 2).

### 7<sub>oom</sub>

Identifies the current zoom factor of the camera (1x, 2x, 4x, or 8x).

### Averaging period

Select the appropriate averaging period as a means of stabilizing the long term bit rate.

#### 4.6.7 **Image Posting**

Save individual JPEG images on an FTP server at specific intervals.

### **JPEG**

### Image size

Select the size of the JPEG images that are to be sent from the camera. JPEG resolution corresponds to the highest setting from the two data streams.

### File name

Select how file names are created for the individual images that are transmitted.

- Overwrite: The same file name is always used and any existing file will be overwritten by the current file.
- Increment: A number from 000 to 255 is added to the file name and automatically incremented by 1. When it reaches 255, it starts again from 000.
- Date/time suffix: The date and time are automatically added to the file name. When setting this parameter, make sure that the date and time of the device are always set correctly. For example, the file snap011005 114530.jpg was stored on October 1, 2005 at 11:45 and 30 seconds.

### VCA overlays

If you have enabled the display of VCA overlays on the Appearance page, select the VCA **overlays** check box to have the overlays also visible in the JPEG image.

### **Posting interval**

Enter the interval in seconds at which the images are sent to an FTP server. Enter zero for no images to be sent.

### **Target**

Select the target account for JPEG posting.

### Notice!

You must configure an account in order to have functionality for Image Posting. Click on Configure accounts to do so.

Click **Set** to apply the changes.

#### 4.7 Alarm

#### 4.7.1 Alarm Connections

In the event of an alarm, the unit can automatically connect to a pre-defined IP address. The unit can contact up to ten IP addresses in the order listed until a connection is made.

### Connect on alarm

Select On so that the unit automatically connects to a pre-defined IP address in the event of an alarm

Select Follows input 1 so that the unit maintains the connection for as long as an alarm exists on alarm input 1.

### **Auto-connect**

Select **On** to automatically re-establish a connection to one of the previously specified IP addresses after each reboot, connection breakdown, or network failure.

### Number of destination IP address

Specify the numbers of the IP addresses to be contacted in the event of an alarm. The unit contacts the remote locations one after the other in the numbered sequence until a connection is made.

### **Destination IP address**

For each number, enter the corresponding IP address for the desired remote station.

### Destination password

If the remote station is password protected, enter the password here.

Only ten passwords can be defined here. Define a general password if more than ten connections are required. The unit connects to all remote stations protected by the same general password. To define a general password:

- Select 10 in the **Number of destination IP address** list box.
- Enter 0.0.0.0 in the **Destination IP address** field. 2.
- Enter the password in the **Destination password** field.
- Set the user password of all the remote stations to be accessed using this password. Setting destination 10 to the IP-address 0.0.0.0 overrides its function as the tenth address to try.

### Video transmission

If the unit is operated behind a firewall, select TCP (HTTP port) as the transfer protocol. For use in a local network, select UDP.

To enable multicast operation, select UDP for the Video transmission parameter here and on the Network Access page.

### Note:

In the event of an alarm, a larger network bandwidth is sometimes required for additional video streams (if multicast operation is not possible).

### Stream

Select a stream to be transmitted.

### Remote port

Select an appropriate browser port depending on the network configuration.

The ports for HTTPS connections are only available if **SSL encryption** is set to **On**.

### Video output

If a hardware receiver is used, select the analog video output to which the signal should be switched. If the destination device is unknown, select First available. This places the image on the first video output with no signal.

The connected monitor only displays images when an alarm is triggered.

### Note:

Refer to the destination unit documentation for more information on image display options and available video outputs.

### Decoder

If a split image is set for the selected video output, select a decoder to display the alarm image. The decoder selected determines the position in the split image.

### SSL encryption

SSL encryption protects data used for establishing a connection, such as the password. By selecting On, only encrypted ports are available for the Remote port parameter. SSL encryption must be activated and configured on both sides of a connection.

The appropriate certificates must also have been uploaded. (Certificates can be uploaded on the Certificates page.)

Configure and activate encryption for media data (such as video, metadata or audio when available) on the Encryption page (encryption is only available if the appropriate license is installed).

### **Audio**

Select **On** to transmit the audio stream with an alarm connection.

Click **Set** to apply the changes.

#### 4.7.2 Video Content Analysis (VCA)

The camera has integrated Video Content Analysis (VCA) which detects and analyzes changes in the picture using image processing algorithms. Such changes can be due to movements in the camera's field of view. Detection of movement can be used to trigger an alarm and to transmit metadata.

Various VCA configurations can be selected and adapted to your application, as required. Configure the VCA setting in the Bosch Configuration Manager.

#### 4.7.3 **Audio Alarm**

Alarms can be generated based on audio signals. Configure signal strengths and frequency ranges so that false alarms, for example, machine noise or background noise, are avoided. Set up normal audio transmission before configuring the audio alarm.

### Audio alarm

Select **On** for the device to generate audio alarms.

### Name

The name makes it easier to identify the alarm in extensive video monitoring systems. Enter a unique and clear name here.

en | Configuration

# Signal Ranges

Exclude particular signal ranges in order to avoid false alarms. For this reason the total signal is divided into 13 tonal ranges (mel scale). Check or uncheck the boxes below the graphic to include or exclude individual ranges.

### **Threshold**

Set up the threshold on the basis of the signal visible in the graphic. Set the threshold using the slide control or move the white line directly in the graphic using the mouse.

### Sensitivity

Use this setting to adapt the sensitivity to the sound environment and effectively suppress individual signal peaks. A high value represents a high level of sensitivity. Click **Set** to apply the changes.

### 4.7.4 Alarm E-Mail

Alarm states can be documented by e-mail. The camera automatically sends an e-mail to a user-defined e-mail address. This makes it possible to notify a recipient who does not have a video receiver.

### Send alarm e-mail

Select **On** for the device to automatically send an alarm e-mail in the event of an alarm.

### Mail server IP address

Enter the IP address of a mail server that operates on the SMTP standard (Simple Mail Transfer Protocol). Outgoing e-mails are sent to the mail server via the address entered. Otherwise, leave the box blank (**0.0.0.0**).

### SMTP port

Select the appropriate SMTP port.

### SMTP user name

Enter a registered user name for the chosen mail server.

### SMTP password

Enter the required password for the registered user name.

### **Format**

Select the data format of the alarm message.

- **Standard (with JPEG)**: e-mail with JPEG image file attachment.
- **SMS**: e-mail in SMS format to an e-mail-to-SMS gateway without an image attachment.

When a mobile phone is used as the receiver, make sure to activate the e-mail or SMS function, depending on the format, so that these messages can be received. Obtain information on operating your mobile phone from your mobile phone provider.

### Image size

Select the size of the JPEG images that are to be sent from the camera.

### Attach JPEG from camera

To send a JPEG image from a particular video channel, check the appropriate box.

### VCA overlays

Select the **VCA overlays** check box, to place the outline of the object that triggered an alarm into the camera image sent as snapshot via e-mail.

### **Destination address**

Enter the e-mail address for alarm e-mails here. The maximum address length is 49 characters.

### Sender address

Enter a unique name for the e-mail sender, for example, the location of the device. This makes it easier to identify the origin of the e-mail.

### Test e-mail

Click **Send Now** to test the e-mail function. An alarm e-mail is immediately created and sent. Click **Set** to apply the changes.

### 4.7.5 **Alarm Inputs**

### **Active**

Configure the alarm triggers for the unit.

Select N.C. (Normally Closed) if the alarm is to be triggered by opening the contact.

Select N.O. (Normally Open) if the alarm is to be triggered by closing the contact.

### Name

Enter a name for the alarm input. This is then displayed below the icon for the alarm input on the **Live** page (if configured).

### Action

Select a type of action to be performed when an alarm input occurs:

- None
- Monochrome

This switches the camera to the monochrome mode.

### Switch mode

When this is selected, you can select the Scene Mode to be used for the active and inactive period of the alarm.

Click Set to apply the changes.

### 4.7.6 **Alarm Outputs**

Configure the switching behavior of the output.

Select different events that automatically activate an output. For example, turn on a floodlight by triggering a motion alarm and then turn the light off again when the alarm has stopped.

### Idle state

Select Open for the output to operate as a normally open contact, or select Closed if the output is to operate as a normally closed contact.

### **Operating mode**

Select the way the output works.

For example, if you want an activated alarm to stay on after the alarm ends, select Bistable. If you wish an activated alarm to stay on for ten seconds for example, select 10 s.

### **Output follows**

Select the event that triggers the output.

### **Output name**

The alarm output can be assigned a name here. This name appears on the Live page.

### **Toggle**

Click the button to switch the alarm output manually (for example, for testing purposes or to operate a door opener).

Click Set to apply the changes.

### 4.7.7 **Alarm Task Editor**

Editing scripts on this page overwrites all settings and entries on the other alarm pages. This procedure cannot be reversed.

To edit this page, you should have programming knowledge and be familiar with the information in the Alarm Task Script Language document and the English language.

As an alternative to the alarm settings on the various alarm pages, enter the desired alarm functions in script form here. This will overwrite all settings and entries on the other alarm pages.

- Click Examples under the Alarm Task Editor field to see some script examples. A new window opens.
- 2. Enter new scripts in the Alarm Task Editor field or change existing scripts in line with your requirements.
- 3. When finished, click **Set** to transmit the scripts to the device. If the transfer was successful, the message **Script successfully parsed.** is displayed over the text field. If it was not successful, an error message is displayed with further information.

## 4.8 Network

The settings on these pages are used to integrate the device into a network. Some changes only take effect after a reboot. In this case **Set** changes to **Set and Reboot**.

- 1. Make the desired changes.
- 2. Click Set and Reboot.

The device is rebooted and the changed settings are activated.

## 4.8.1 Network Services

This page shows an overview of all available network services. Use the checkbox to activate or deactivate a network service. Click on the settings symbol next to the network service to go to the settings page for this network service.

Click Set to apply the changes.

Some changes only take effect after the unit is rebooted. In this case, the **Set** button changes to **Set and Reboot**.

### 4.8.2 Network Access

If the IP address, subnet mask, or gateway address is changed, then the device is only available under the new addresses after the reboot.

### **Automatic IPv4 assignment**

If the network has a DHCP server for the dynamic assignment of IP addresses, select  $\mathbf{On}$  to automatically accept the DHCP-assigned IP address.

For certain applications, the DHCP server must support the fixed assignment between IP address and MAC address, and must be appropriately set up so that, once an IP address is assigned, it is retained each time the system is rebooted.

### **Ethernet**

The Ethernet options are defined in this section.

### IPv4

## **IP address**

Enter the desired IP address for the camera. The IP address must be valid for the network.

### Subnet mask

Enter the appropriate subnet mask for the set IP address.

### **Gateway address**

For the device to establish a connection to a remote location in a different subnet, enter the IP address of the gateway here. Otherwise, this field can remain empty (0.0.0.0).

## IPv6

### IP address

Enter the desired IP address for the camera. The IP address must be valid for the network.

### **Automatic address**

Displays the automatic address.

### **Prefix length**

Enter the appropriate prefix length for the set IP address.

### **Gateway address**

For the device to establish a connection to a remote location in a different subnet, enter the IP address of the gateway here. Otherwise, this field can remain empty (0.0.0.0).

### DNS server address 1/DNS server address 2

The device is easier to access if it is listed on a DNS server. For example, to establish an Internet connection to the camera, it is sufficient to enter the name given to the device on the DNS server as a URL in the browser. Enter the DNS server's IP address. Servers are supported for secure and dynamic DNS.

### Video transmission

If the device is used behind a firewall, TCP (HTTP port) should be selected as the transmission protocol. For use in a local network, choose UDP.

Multicast operation is only possible with the UDP protocol. The TCP protocol does not support multicast connections.

### TCP rate control

Select On if you want to allow Adaptive Bit Rate encoding.

### **HTTP** browser port

Select a different HTTP browser port from the list if required. The default HTTP port is 80. To limit connection to HTTPS, deactivate the HTTP port. To do this, activate the **Off** option.

### **HTTPS** browser port

To limit browser access to encrypted connections, choose an HTTPS port from the list. The standard HTTPS port is 443.

The camera uses the TLS 1.0 protocol. Ensure that the browser has been configured to support this protocol. Also ensure that Java application support is activated (in the Java Plugin Control Panel of the Windows Control Panel).

To limit connections to SSL encryption, set the Off option in the HTTP browser port and the RCP+ port. This deactivates all unencrypted connections allowing connections on the HTTPS port only.

### **Minimum TLS version**

Select the version for minimum Transport Layer Security (TLS).

### Allow HTTP basic authentication

Select On if you want to allow HTTP basic authentication. This is a less secure authentication option where passwords are transmitted in clear text. This option should only be used if the network and system are otherwise secured.

### **HSTS**

Select this option to use the web security policy HTTP Strict Transport Security (HSTS) to provide secure connections.

### RCP+ port 1756

Activating RCP+ port 1756 allows unencrypted connections on this port. To allow only encrypted connections, set the **Off** option to deactivate the port.

### Discovery port (0 = Off)

Enter the number of the port that you want to discover.

To deactivate the port, enter 0.

### **Network MSS [Byte]**

Set the maximum segment size for the IP packet's user data here. This gives the option to adjust the size of the data packets to the network environment and to optimize data transmission. In UDP mode, comply with the MTU value set below.

### **Network MTU [Byte]**

Specify a maximum value in bytes for the package size (including IP header) to optimize data transmission.

Click **Set** to apply the changes.

### 4.8.3 Advanced

### **RTSP**

### **RTSP** port

If necessary, select a different port for the exchange of the **RTSP** data from the list. The standard **RTSP port** is 554. Select **Off** to deactivate the **RTSP** function.

### 802.1x

### Authentication

To configure Radius server authentication, connect the unit directly to a computer using a network cable. If a Radius server controls access rights over the network, select **On** to activate authentication to communicate with the unit.

### Identity

Enter the user name that the Radius server uses for the unit in the Identity field.

### Password [EAP-MD5]

Enter the Password [EAP-MD5] that the Radius server expects from the unit.

## **Certificates [EAP-TLS]**

Shows the client and server certificates.

Click Configure to go to the Certificates page and manage certificates.

### Syslog

### Server IP address

Enter the appropriate IP address of the server.

### Server port (0 = Off)

Enter the number of the server port.

### **Protocol**

Select the appropriate protocol: UDP, TCP, or TLS.

Click **Set** to apply the changes.

## 4.8.4 Network Management

### **Quality of service**

The camera offers Quality of Service (QoS) configuration options to ensure fast network response to PTZ data and images. Quality of Service (QoS) is the set of techniques to manage network resources. QoS manages the delay, delay variation (jitter), bandwidth, and packet loss parameters to guarantee the ability of a network to deliver predictable results. QoS identifies the type of data in a data packet and divides the packets into traffic classes that can be prioritized for forwarding.

Consult with your network administrator for assistance configuring the **Audio**, **Video**, **Control**, and the **Alarm video** settings, and to select the appropriate **Post-alarm time**.

**Post-alarm time** has a time period from 0 s [seconds] to 3 h [hours]; 15 s [seconds] is the default option.

Click **Set** to apply the changes.

Some changes only take effect after the unit is rebooted. In this case, the Set button changes to Set and Reboot.

### 4.8.5 Multicast

The device can enable multiple receivers to receive the video signal simultaneously. The stream is either duplicated and then distributed to multiple receivers (Multi-unicast), or it is sent as a single stream to the network, where it is simultaneously distributed to multiple receivers in a defined group (Multicast).

Multicast operation requires a multicast-enabled network that uses UDP and the Internet Group Management protocol (IGMP V2). The network must support group IP addresses. Other group management protocols are not supported. The TCP protocol does not support multicast connections.

A special IP address from 225.0.0.0 to 239.255.255.(class D address) must be configured for multicast operation in a multicast-enabled network. The multicast address can be the same for multiple streams, however, it is necessary to use a different port in each case.

The settings must be made individually for each stream. Enter a dedicated multicast address and port for each stream.

The video channels can be individually selected for each stream.

Enable simultaneous data reception on receivers that need to activate the multicast function. To do this, check the box and enter the multicast address.

### **Multicast Address**

Enter a valid multicast address to be operated in multicast mode (duplication of the data stream in the network).

With a 0.0.0.0 setting, the encoder for the stream operates in multi-unicast mode (copying of data stream in device). The camera supports multi-unicast connections for up to five simultaneously connected receivers.

Duplication of data places a heavy demand on the CPU and can lead to impairment of the image quality under certain circumstances.

### **Port**

Enter the port address for the stream here.

### Streaming

Click the checkbox to activate multicast streaming mode. An activated stream is marked with a check. (Streaming is typically not required for standard multicast operation.)

### Metadata

You can enable multicast metadata here. The configuration follows the same pattern as for video multicast, but without the streaming option.

Define a multicast address and define a port.

### Audio

You can enable multicast audio for different encoders here. The configuration follows the same pattern as for video multicast, but without the streaming option.

Define a multicast address and define a port for the different encoders.

### Multicast packet TTL

A value can be entered to specify how long the multicast data packets are active on the network. If multicast is to be run via a router, the value must be greater than 1.

### **IGMP** version

Set the multicast IGMP version to comply with the device.

Click **Set** to apply the changes.

Some changes only take effect after the unit is rebooted. In this case, the Set button changes to Set and Reboot.

### 4.8.6 **IPv4 Filter**

Use this setting to configure a filter that allows or blocks network traffic that matches a specified address or protocol.

### IP Address 1 / 2

Enter the IPv4 address that you want to allow or block

### Mask 1 / 2

Enter the subnet mask for the appropriate IPv4 address.

Click **Set** to apply the changes.

### 4.9 Service

### 4.9.1 Maintenance

### Notice!

Before starting a firmware update, make sure to select the correct upload file.

Do not interrupt the firmware installation. Even changing to another page or closing the browser window leads to interruption.

Uploading the wrong files or interrupting the upload can result in the device no longer being addressable, requiring it to be replaced.

The camera functions and parameters can be updated by uploading new firmware. To do this, the latest firmware package is transferred to the device via the network. The firmware is installed there automatically. Thus, a camera can be serviced and updated remotely without requiring a technician to make changes to the device on site. The latest firmware can be obtained from your customer service center or from the download area.

### Update server

The address of the update server appears in the address box.

- Click **Check** to make a connection to this server.
- 2. Select the appropriate version for your camera to download the firmware from the server.

## **Firmware**

To update the firmware:

- 1. First, store the firmware file on your hard disk.
- Enter the full path for the firmware file in the field or click **Browse...** to locate and select the file.
- Click **Upload** to begin transferring the file to the device. The progress bar allows monitoring of the transfer.

The new firmware is unpacked and the Flash memory is reprogrammed. The time remaining is shown by the message going to reset Reconnecting in ... seconds. When the upload is completed successfully, the device reboots automatically.

## **Upload history**

Click **Show** to view the firmware upload history.

### Configuration

Save configuration data for the device to a computer and load saved configuration data from a computer to the device.

To load configuration data from the computer to the device:

- Click **Browse...**. A dialog box appears.
  - Make certain that the file to be loaded comes from the same device type as the device to be reconfigured.
- Locate and open the desired configuration file. If the configuration file is passwordprotected, enter the password.
- 3. Click Upload.

The progress bar allows monitoring of the transfer. The time remaining is shown by the message going to reset Reconnecting in ... seconds. When the upload is completed successfully, the device reboots automatically.

To save the camera settings:

- 1. Click **Download**. A dialog box appears.
- 2. Enter a password to protect the configuration file.
- Enter a file name if required and save the file.

### Maintenance log

Download an internal maintenance log from the device to send it to Customer Service for support purposes. Click **Download** and select a storage location for the file.

### 4.9.2 Licenses

This window activates more functions with use of an Activation key. An overview of the **Installed licenses** is shown. Also, the **Installation code** of the unit is shown.

Click **Set** to apply the changes.

### 4.9.3 Certificates

### Add a certificate/file to the file list

Click Add.

In the Add certificate window, select:

- **Upload certificate** to select a file that is available:
  - Click **Browse...** to navigate to the necessary file.
  - Click Upload.
- **Generate signing request** for a signing authority to create a new certificate:
  - Fill in all the necessary fields.
  - Click Generate.
- Generate certificate to create a new self-assigned certificate:
  - Fill in all the necessary fields.
  - Click Generate.

Note: When using certificates for mutual authentication, the device must use a solid and trusted time base. In case the time differs too much from the actual time, a client can be locked out. Then, only a reset to factory defaults will access to the device again.

### Delete a certificate from the file list

Click the trashcan icon to the right of the certificate. The Delete file window appears. To confirm deletion, click OK. To cancel deletion, click Cancel.

Note: You can only delete certificates that you have added; you cannot delete the default certificate.

### Download a certificate

Click on the download icon and a window opens with base64 encoded text of the certificate.

Click **Set** to apply the changes.

### 4.9.4 Logging

## **Event Logging**

### **Current log level**

Select the level of event for which to display log entries or to log.

## Number of displayed entries

Select the number of entries to display.

### **Software Sealing**

### **Enable software sealing**

Select this check box to enable software protection that prevents users from adjusting camera settings. This function also protects the camera from unauthorized access.

### **Debug Logging**

Retrieves detailed information of the active logs.

### Reload

Reloads the displayed entries.

## **Download log**

Save a copy of the entries from the device to a computer.

To save the entries:

Click **Download log**; a dialog box appears.

Enter a file name if required and save

### 4.9.5 **System Overview**

This window is for information only and cannot be modified. Keep this information at hand when seeking technical support.

Select the text on this page with a mouse and copy it so that it can be pasted into an e-mail if required.

### **Troubleshooting** 5

### 5.1 Physical reset button

Each camera has a hardware reset button. You may need to press the reset button to reset the camera to factory defaults if you encounter the following circumstances:

- You can power up the camera but cannot log on to the camera using the web browser.
- The camera doesn't start up, or fails to power up via PoE.
- The camera cannot search an IP address.
- The camera's firmware crashed.
- You forgot the password to access the camera.
- The image becomes frozen.
- You cannot update the firmware.
- The camera disconnects from the network at random and needs a reboot.
- The camera no longer finds pre-positions (preset positions).
- You cannot configure the camera using the web browser.
- The camera has no video out.

### Notice!

A factory default deletes all camera settings including passwords, network settings, and image settings.

Complete the following sequence of steps only if you have no other option to restore operation to the camera.

### Steps to complete a hardware reset for all camera models

- Apply power to the camera. Search for the IP address, and then log on to the camera using the web browser. (Note: You can use Configuration Manager to identify the IP address.)
- 2. Find the hardware reset button on the camera block. (See each section below to locate the reset button for your camera model.)
- 3. Push and hold the reset button for more than 3 seconds. The red LED indicator on the PCBA board will begin flashing to show that the hardware reset started.
- 4. Let the camera complete a self-check. When the self-check completes, the red LED will
- 5. Search again for the IP address. Access the camera using the web browser. Set the initial password for the camera.

For DINION inteox 7100i IR, the reset button is in a slot in the back of the camera, next to the SD card slot. To access the reset button, remove the cover.

For FLEXIDOME inteox 7100i, the reset button is next to the LED light. To access the reset button, remove the camera bubble.
