## Technical Bulletin Output relays not resetting when used with powered loop devices on B/G series panels.

## September 18, 2019

## Issue

Output relay assigned to powered loop (D125B) or POPIT devices may not reset after alarm.

## Workaround

Create a Custom Function to reset the Alarm output. Include this Custom Function in the Shortcut Menu. After Resetting Sensors activate the Custom Function to reset output and delete Event Memory.

Alternative: Reactivate the same alarm and then reset a second time.

Second alternative: Use CMD 54 to reset the relay/output assigned to the devices.
